

Point Repair

We help you fix pipes.

Infrastructure contractors depend on innovative technologies to be more profitable in pipeline rehabilitation. Pipeline Renewal Technologies delivers that innovation to processes ranging from relining to pipe point repair and lateral reinstatement.

We are committed to maximizing your competitive advantage by delivering superior training and support which minimizes your downtime and cost-of-ownership. Contact us anytime for more information or with any questions you have.

For trenchless, standalone point repair, or for pre-lining under high infiltration, these products restore a pipe's structural integrity where vulnerable, and seal out groundwater.

Quick-Lock

Target failing pipes with a point repair sleeve that installs in minutes

Positioned by a crawler and expanded pneumatically with an air compressor, Quick-Lock's rehab caps and sleeves provide structural, trenchless pipe repair and sealing. Use a push-rod to position in lines as small as 4".

Installs in minutes with minimal manpower and overhead. Quick-Lock is chemically resistant against sewage, thinned acids, lye, and aromatic and chlorinated hydrocarbons. Heavy-gauge 316L stainless steel construction has infiltration abatement with an EPDM rubber gasket.

The patented locking system ensures that the sleeve stays permanently in position. After rehabilitation, the sleeve has its own static capability and absorbs the natural tectonic movements of the pipes.

Meets ASTM F3110-14 for mechanical trenchless point repair.

Sizes to fit 4" to 72" lines.
